H; high level, L; low level, X; irrelevant, ↓; transition from high to low level,

Q_0 ; level of Q before the indicated steady-state input conditions were established.

\bar{Q}_0 ; complement of Q_0 or level of Q before the indicated steady-state input conditions were established.

Toggle; each output changes to the complement of its previous level on each active transition indicated by ↓.

* This configuration is nonstable; that is, it will not persist when preset and clear inputs return to their inactive (high)

** I_{IL} should not be measured when preset and clear inputs are low at same time.

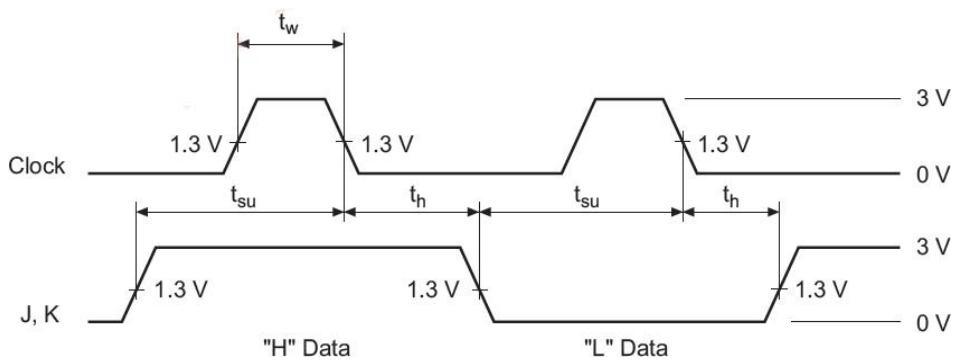

*** With all outputs open, I_{CC} is measured with the Q and \bar{Q} outputs high in turn. At the time of measurement, the clock input is grounded.
